

# Unix Essentials

Devin J. Pohly <djpohly@cse.psu.edu>

# The Unix Philosophy

- Write programs that do one thing and do it well.
  - Write programs to work together.
  - Write programs to handle text streams, because that is a universal interface.
- 
- Doug McIlroy, Unix patriarch

# Command line interface

- Command line? Why?
  - Efficient and powerful
  - Scriptable
  - Simple and reliable
    - Always works... even if everything else is b0rked!
- What is it?
  - Shell program (“bash” on Linux)
  - Interprets built-in commands
  - Runs other programs
  - Runs shell scripts

# Getting started

- Boot the VM
- Log into the GUI
- Open Terminal Emulator
  - Under Accessories
  - Also on launch panel on the bottom of the screen
- You are now typing input for the shell

# Common command syntax

Program:

```
ls
```

Program with an argument:

```
ls /home
```

Program with an option:

```
ls -l
```

Program with options and an argument:

```
ls -l -a /home
```

```
ls -l --all /home
```

```
ls -la /home
```

# Standard filesystem layout

- Grouped by type
- `/usr`: installed software
  - `/usr/bin`, `/usr/lib`, ...
- `/etc`: configuration
- `/home`: users' own files
- `/dev`: devices
- `/tmp`: temporary files

# Navigating the CLI

- Files

- Listing: `ls`
- Moving/copying: `mv`, `cp`
- Deleting: `rm`

- Directories

- “You are here”: `pwd`
- Moving around: `cd DIR`
- Creating/removing: `mkdir`, `rmdir`
- Special directory names
  - `.` means the current directory
  - `..` means the parent directory

# Help!

- Built-in commands: `help`
- Everything else: `man`
  - Standard layout
  - `man operator`
  - `man ascii`
  - `man man!`
  - Get used to reading these!
- Keyword search: `man -k`
- (Also Google)

# Editing files

- Unix philosophy again:  
text is important!
  - Configuration? Text files.
  - Scripting? Text files.
  - Programming? Text files.
- Vim (and vi)
  - Do one thing and do it well

# Vim setup

```
sudo apt-get install vim
```

```
wget -U mozilla tiny.cc/311setup
```

```
sh 311setup
```

# Understanding Vim

- “Modal” editor
  - Mode indicator in bottom-left corner
- Normal mode (default)
  - Navigate the file
  - Everything except typing text
  - When in doubt, **Esc** will put you in Normal mode.
- Insert mode
  - Typing text

# Vim: getting around

- Arrows optional!
  - Moving: **h**, **j**, **k**, **l**
  - Paging: Ctrl-f/b, Ctrl-u/d
  - Other keys work too
- Searching: **/**
  - (Regular expressions)
- Practice:  
`vim /etc/services`
- To quit, type **:q**, Enter in Normal mode.

# Vim: making changes

- In Normal mode:
  - i to insert at cursor
  - A to append to line
  - o to open a line below
  - O to open a line above
  - u for unlimited undo!
- Esc: return to Normal
- Practice: `vim hello.c`
- Write and quit: `:wq`

# Salutations!

- Make a file `hello.c`, containing:

```
#include <stdio.h>
```

```
int main(void)  
{
```

```
    printf("yo dawg\n");
```

```
    printf("I mean hello world\n");
```

```
    return 0;
```

```
}
```

- Write and quit: `:wq`, Enter.
- It's OK if you don't understand the exact details.

# Compile and run

- Run the compiler:  
`gcc -o hello hello.c`
- Execute the program:  
`./hello`
- Edit it again
  - Delete a printf by moving to it and pressing “dd”.
  - Now add another printf by using the “o” command.
    - Notice that “o” puts you in Insert mode!
- Write, quit, compile, run!

# Shell scripting

- Getting tired of typing  
`gcc -o hello hello.c`  
yet?
- Shell script = list of  
commands to run
- Put this line in a file  
called `build.sh`.
- Now just run  
`sh build.sh`

# Learning Vim

- Run `vimtutor` at the command line
  - Super simple introduction
  - I'd *highly* recommend going through 2 or 3 lessons
- `:help`
  - `:help user-manual`
- Many, many features
  - Find the things that work for you
- Practice!
  - GVim for Windows, MacVim for Mac

```
[No Name]                                0,0-1      All
The "0" command doesn't take a count argument, because the "0" would be
part of the count. Unexpectedly, using a count with "^" doesn't have any
effect.

=====
03.3    Moving to a character

One of the most useful movement commands is the single-character search
command. The command "fx" searches forward in the line for the single
character x. Hint: "f" stands for "Find".
For example, you are at the beginning of the following line. Suppose you
want to go to the h of human. Just execute the command "fh" and the cursor
will be positioned over the h:

    To err is human. To really foul up you need a computer.
    ----->
           fh           fy

This also shows that the command "fy" moves to the end of the word really.
You can specify a count; therefore, you can go to the "l" of "foul" with
"3fl":

    To err is human. To really foul up you need a computer.
    ----->
                        3fl

usr_03.txt [Help][R0]                      97,1      15%
Type :quit<Enter> to exit Vim
```
